### INFLATION

### Bottom Line Up Front:

Source: OECD data; dataviz.blog

- Inflation is the rise in the general level of prices for goods and services in an economy, diminishing the purchasing power of money. Domestically, it influences individual purchasing power, savings, and investment decisions, while globally, it can impact a country's competitive position in trade, affecting the dynamics and stability of both local and international economies.
- Since the onset of the COVID pandemic, the US experienced a notable rise in inflation driven by supply chain disruptions, increased demand for certain goods and services, and an unprecedented amount of government stimulus.
- In the US, the annual inflation rate was 3.7% for the 12 months ending in August 2023, following a rise of 3.2% in the previous period. The trend over the course of 2023 shows a decrease in inflation from 6.4% in January to 3.7% in August; and though the Federal Reserve's approach has helped bring numbers down by raising rates has been helpful, it's yet to meet it target of 2%.
- Considering the significant and persistent rise in inflation during the recent cycle, there's growing debate about the feasibility of the Fed reverting to its traditional 2% year-over-year inflation target in the current global economic and geopolitical environment.

## **INFORMATION**

A view of the information space related to the topic of the week, based on headline frequency.

Inflation defined: Inflation refers to the rise in the general level of prices for goods and services in an economy over time, leading to decreased purchasing power of money. Moderate inflation is often viewed as indicative of a growing economy, but excessive inflation can erode money's value and create economic uncertainty. Central banks use tools like interest rate adjustments to control inflation, which impacts everything from savings and investments to international competitiveness.

Why this topic is important right now: Mid-2021 the world saw inflation starting to rise to a level most countries hadn't seen in decades. There was no-single event responsible for this surge, but rather a combination of events both leading up to, and sustaining through, what has become a very noisy topic over the last couple of years. Today however, potentially represents a point in time worth bring attention to, especially on the heels of last week's Federal Open Market Committee (FOMC). Inflation measured by the Consumer Price Index (CPI) and Personal Consumption Expenditures (PCE) has already 'peaked' and worked its way down over the last 12 months. But what's less-obvious (and arguably more interesting) is what happens at these critical turning points (e.g., from hiking rates to holding to cutting) when there is still so much "stuff" to work its way through the system.

A few things to consider: The Fed has increased rates 11 times since early 2022 in an attempt to bring inflation down; last week's hold on rates could be the start-of-the-end of this intense hiking cycle; though inflation numbers are down considerably (3.7%) from their peak (9.1%), they're not where the Fed wants them (2%); the time it took to move from 9.1% to 3.7% will not be equal to the time it takes to get to 2%; now is a good time to engrain the differences between headline and core inflation numbers.

### **TECHNOLOGY**

The intricate relationship between inflation and the global economic landscape is becoming more pronounced, with technology increasingly acting as a crucial mediator. While e-commerce platforms powered by AI introduce dynamic pricing mechanisms that could inadvertently contribute to inflationary trends, they also bring forth adaptive solutions. Predictive analytics and AI-driven tools across sectors like energy, real estate, and finance enable businesses and individuals to preempt and navigate the turbulent waters of inflation. This shift towards a proactive technological approach not only aids in understanding the intricacies of inflation but also offers strategies to counteract its ripple effects.

In the commercial world, consumers find assistance in Al-enhanced financial apps and e-commerce platforms. These tools offer insights that influence budgeting and purchasing decisions, especially pertinent in inflationary climates. The manufacturing sector reflects another dimension of this interplay. The push towards automation, though efficient, raises concerns about potential job losses, marking a significant trade-off. In essence, technology-driven solutions, born out of economic pressures, are rapidly shaping industrial strategies.

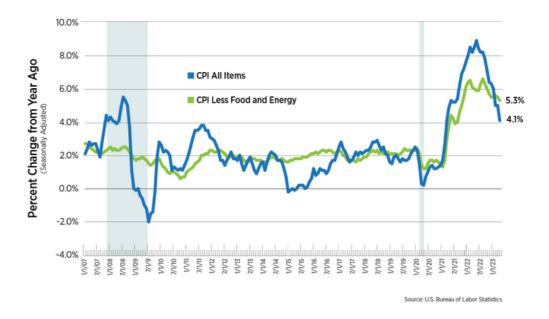

Internationally, political climates provide further testament to technology's pivotal role in addressing inflation. Advanced data analysis tools, capturing real-time public sentiment, provide valuable insights to governments and policymakers, enabling them to adapt to the ever-evolving opinions of their constituents. From the automotive sector's unrest in Detroit to Argentina's inflation-induced electoral dynamics, data remains an essential component in strategic decision-making.

Furthermore, sectors beyond finance and e-commerce are ripe for technological integration. The energy industry, a dominant player in inflation trends, is on the brink of a tech-led transformation. As oil prices fluctuate, a strategic pivot towards alternative energy solutions is not only innovative but economically prudent. Similarly, the real estate market, a foundational segment, is gearing up for a tech-driven overhaul, ensuring housing remains accessible in inflationary environments.

### **Consumer Price Index**

( As of May 2023)

Sentiment surrounding inflation is a very spread. Looking at age, income level, education level and geographic location gives the best understanding of the sentiment across different demographics.

**Age:** Younger people have different perceptions of inflation compared to older generations, for instance due to having experienced periods of higher inflation such as the 1970s firsthand and being more sensitive to its impacts than others. By contrast, younger generations rely more on economic education or news sources for understanding about inflation than being personally exposed to it first-hand.

**Income Level:** Individuals with lower incomes are more sensitive to price increases due to a larger portion of their budget going towards basic needs; higher-income individuals may have greater flexibility to absorb price hikes.

**Education Level:** Individuals with higher levels of education possess a deeper knowledge of economic principles, including inflation, and are better equipped to interpret economic data and forecasts.

**Geographic Location:** Economic conditions vary across regions, which influences how individuals perceive and experience inflation differently in different parts of the country.

**Occupation and Industry:** People working in consumer goods and retail suggested that they are more directly impacted by inflation than others, other industries included housing and real estate and hospitality and travel.
